

# RWM

## enamelled wirewound power resistors

- axial leads

As a result of more than 50 years of experience and continuous improvements the RWM Series of resistors features proven reliability in AC or DC applications.

The high quality of the RWM resides mainly in the use of a proprietary SFERNICE enamel fired at high temperature and free from any compound liable to corrode the resistive wire. The performances of this series of professional resistors fully meet the requirements of the following specifications :

- NF C 83-210-001
- CECC 40201-001
- BS - CECC 40201-002
- MIL-R-26 E, RW 67, RW 68 and RW 69 models
- DIN 41 431, (minor variations in dimensions on some models)
- DEF-5115-2, RFH Series

- **HIGH DISSIPATION**
- **HIGH RELIABILITY LEVEL**
  - Fire proof
  - Excellent endurance
  - Conformal vitreous enamel
- **LOW OHMIC VALUES**

- Great mechanical strength
- Good environmental protection
- All welded construction

**TYPICAL TEMPERATURE RISE**

Fig. 3

**MARKING**

SFERNICE trademark, series and style, CECC style, if applicable (except for the smallest model due to lack of space : (4 x 10 or RB 59) ohmic value, resistance tolerance, manufacturing date (year - month).

**RELIABILITY**

The reliability rate is checked during endurance tests carried out on batches taken from the production line and covering the entire ohmic range. The typical results achieved at Pr (90°/30° cycle) and 25°C ambient allow us to state positively that, with 10, 10 million units x hours, the failure rate is below 3,9x10<sup>-7</sup> (60 % confidence level).

**OVERLOAD**

Heavy overloads can be endured in the form of short pulses < 0,1 s. Particular cases should be submitted to SFERNICE, specifying peak voltage, cycle and environmental conditions.

**RECOMMENDATIONS FOR USE**

Since these components are high dissipation power resistors, customers are advised to use a high melting point solder. For low ohmic values, the measurement becomes critical and the connecting wires resistance is to be included. The value is measured at 5 mm from the resistor body.

**GROUP MOUNTING :** in a still atmosphere, a distance between axes equal to five times the resistor's diameter is recommended.

**CABINET MOUNTING :**

- Unventilated box : dissipation should be reduced (see fig. 1).
  - Forced ventilation : if conditions are appropriate, dissipation may be doubled or even trebled.
  - In any case : the surface temperature at the hottest point should not exceed 450°C.
- These aspects should be considered by the end user.

**SPECIFICATIONS**

- Tolerance : ± 5% standard  
±1% to ±10% on request.
- Temperature coefficient : +75 ppm/°C typical.
- Dielectric withstanding voltage : 1000 V RMS.
- Inductance : non inductive (Ayrton-Perry) winding available.

**ORDERING PROCEDURE**
